

Software Engineer - Content and Media - Contingent

## Description

\*This is a contingent staff position expected to last up to 12 months with the possibility of renewal and/or conversion to regular employment\*

We are looking for a Software Engineer with a passion for and experience in content focused web applications and platform solutions.

Work has begun to create an advanced next generation content creation and delivery pipeline.

We are looking for a very strong Software engineer to participate in the infrastructural development of this pipeline which emphasizes easy creation and delivery of content of the Client to the various delivery channels. The candidate will need good communication skills as he/she interacts and works with other groups to understand and develop horizontal tools and technologies to aid other groups in building content focused solutions.

The engineer will work on tasks and assignments from a Team Lead. This position employs an experienced professional, using good knowledge, skills and abilities with technology and programming languages to plan, design, develop, test software, debug, modify, and write documentation and procedures for installation and maintenance of solutions which sustain the rapidly growing needs of a diverse customer population.

The Software Engineer participates in designing major components, breaks down work assignments, estimates task completion time, and fulfills these assignments within the timeframe established. The customer expectation is that the Software Engineer, as a member of the technology team, will deliver a quality, technological solution that meets or exceeds the requirements of the customer and is delivered within the defined schedule and cost constraints.

The Software Engineer is able to work with minimal supervision, and must utilize his or her experience, understanding of professional concepts, and knowledge of Client policy and procedures to exercise judgment and creativity in selecting methods, techniques, and evaluation criteria in order to solve complex issues requiring an evaluation of variable factors.
