

Description

The Configuration Management Engineer (Development) works as a technical leader on tasks and assignments related to configuration and build management. This position employs an experienced CM engineer, using extensive knowledge, skills and abilities to provide regular builds, maintain a diverse build environment of tools and applications, automate all aspects of build management, incorporate good processes and practices into daily tasks, and document processes and procedures for assigned responsibilities.

Qualifications

- Must have worked as a Build or Configuration Management Engineer through the first and subsequent releases of several (2+) successful software products.
- Must have a sound understanding of the concepts employed in Software Configuration Management.
- Must have a good working knowledge of source code control practices.
- Must have experience with Continuous Integration automation processes.
- Experience with Team Foundation Server is a plus.
- Must be able to adapt to changing requirements and assignments.
- Experience with Dot Net, MAVEN2, or similar tools are a plus
