

Sr. Engineer (Quality Assurance - Automation) –

Our QA Engineers are probably a little different than most. We need them to be good programmers who can pair program with developers and “white box” test different types of code. Our engineers lead the Quality Assurance effort on every project and take part in all of the decisions concerning project scope, direction, readiness, architecture, etc. They demonstrate ownership, accountability, and commitment to their projects.

Our engineers are much more than “testers” who have used “record and replay” software. We are looking for skilled, seasoned software professionals who are excited to learn but who have the experience to bring new ideas and practices to our team.

We need technology experts in many areas, including:

- J2EE applications
- Web based applications
- Load / Performance testing
- Internationalization and Localization testing
- Enterprise Financial software
- Vignette Content Management
- Security
- SQL Databases

Our engineers work with languages and source tools like Selenium, Marathon, Ruby, Perl, Python, C++, C#, .Net. They need to know how to choose the best tools, or if one is not available, to create his or her own. They need to be eager to break software quickly and have the expertise to focus on the most important and critical areas.

Qualifications

- Bachelor's Degree or equivalent experience
- 8+ years of relevant experience
- Demonstrated small team leadership ability and expertise with major products
- Track record of specific application of this knowledge resulting in project success
- Track record of isolating difficult issues at the subsystem or project level
- Verifiable knowledge of C#, C++, and Java
-
